The shape and size of a bird's beak can tell us what it eats and sometimes how it catches its prey. Most birds, except for parrots and birds of prey, such as eagles and falcons, catch and hold their food with their beak, or bill, alone. Birds' beaks have a great range of specialized shapes to catch and eat different kinds of food.

diverse, encompassing many accommodations to perform a wide variety of functions..

Most birds are classified as digitigrade animals, meaning they walk on their toes, rather than the entire foot. Some of the lower bones of the foot (the distals and most of the metatarsal) are fused to form the tarsometatarsus - a third segment of the leg, specific to birds.
