The organic brain syndrome is generally defined as a process of chronic progressive deterioration of cognitive, including memory, functions with secondary emotional, personality, and behavior disturbances. But while it has many different causes, its occurrence is most prevalent in association with the aging process.

Neuropharmacology is the study of how drugs affect cellular function in the nervous system, and the neural mechanisms through which they influence behavior. There are two main branches of neuropharmacology one is behavioral and the other one is molecular. Behavioral neuropharmacology focuses on the study of how drugs affect human behavior (neuropsychopharmacology), including the study of how ...

Neuropharmacology is the scientific study of the effects of drugs on the nervous system. Its primary focus is the actions of medications for psychiatric and neurologic disorders as well as those of drugs of abuse. Neuropharmacology also uses drugs as tools to form a better understanding of normal nervous system functioning.

The neuropathology data can be queried by selecting brain area and by data category (e.g., RNA, protein, cell (cytoarchitectural), or other). The basic descriptive statistics for a particular neuropathology data set are shown with a histogram. Users can choose a statistical method to use for further analysis based on the data distribution.

Tissues accumulated in the Oregon Brain Bank are made available to researchers according to established protocols. Mission The mission of the Neuropathology Core is to 1) establish the diagnosis of brain disease through a complete evaluation of autopsy tissue, and 2) to make tissue not required for diagnosis available for researchers who study the causes and processes of brain diseases.

Objective: To test the hypothesis that cognitive activity across the life span is related to late-life cognitive decline not linked to common neuropathologic disorders. Methods: On enrollment, older participants in a longitudinal clinical-pathologic cohort study rated late-life (i.e., current) and early-life participation in cognitively stimulating activities. After a mean of 5.8 years of ...
