**Differential calculus  
- Wikipedia**

Basic calculus explains about the two different types of calculus called “Differential Calculus” and “Integral Calculus”. Differential Calculus helps to find the rate of change of a quantity whereas integral calculus helps to find the quantity when the rate of change is known.

INTRODUCTION

Differentiation is one of the most important fundamental operations in calculus. Its theory primarily depends on the idea of limit and continuity of function.

**Differential and  
Integral Calculus 4**

Applications of differential calculus include computations involving velocity and acceleration, the slope of a curve, and optimization.

Applications of integral calculus include computations involving area, volume, arc length, center of mass, work, and pressure.

Differential calculus is basically dealing with the process of dividing something to get track of the changes. On the other hand, Integral calculus adds all the pieces together.

Differentiation deals with the calculation of a derivative which is
