Handedness represents one form of functional hemispheric asymmetries—e. g., left-right differences in the brain. Specifically, in left-handers, the motor cortex in the right side of the brain (the...

but not all people, that induces advantage for the left hemisphere by weakening the right hemisphere. The theory explains associations between handedness and cerebral specialisation for speech, and also handedness in families and twin pairs.

Handedness reflects the structure of our brain, more specifically its asymmetry. The functional differences in the right and left brain hemispheres are believed to underline the phenomenon of hand dominance. Handedness is probably the most obvious manifestation of the fact that our brain functions in an asymmetric manner.

This association between hand and brain captured the imaginations of researchers because it would be so useful (so easy, so non-invasive, so cheap) to study patterns of brain asymmetries by using a person's handedness as a marker for brain lateralization (direct methods involve neurosurgery, invasive drug testing, or expensive imaging techniques).

Brandler and Paracchini suggest the same mechanisms that determine left/right asymmetry in the body (e.g. Nodal signaling and ciliogenesis) also play a role in the development of brain asymmetry (handedness is an outward reflection of brain asymmetry for motor function).

The planum temporale is a brain region within Broca's Area, and is thought to be the most asymmetric area of the human brain; with the left side having shown to be five times the size of the right in some individuals. However in people who are left handed, this asymmetry has shown to be reduced

Handedness and brain asymmetry are widely regarded as unique to humans, and associated with complementary functions such as a left-brain specialization for language and logic and a right-brain specialization for creativity and intuition.

The quantitation of normative brain asymmetry began with the reporting of a highly significant left-sided increase in the planum temporale (Geschwind & Levitsky, 1968) that overlaps with regions of language functions long known to reside primarily in the left hemisphere (Broca, 1861).

Handedness and brain asymmetry are both very important aspects of humans and many other species. They are innate, complicated features that are distinct to everyone. Unfortunately, many people have made assumptions that exaggerate the importance and dominance of one side of the brain from the other.

In this study, we examined the relationship between PCS asymmetry and whether the asymmetry of the PCS is affected by sex, handedness, or race. PCS measurements were obtained from four datasets. The statistical results revealed that the PCS was more often prominent and present in the left hemisphere than in the right.

Left-handedness itself, though, is often associated with the lack of cerebral asymmetry rather than with its reversal, and a great many exceptional individuals have been left handed, including five recent Presidents of the US (Ford, Reagan, George H.W. Bush, Clinton, Obama).
