Linear algebra is, after all, motivated by systems of linear equations. A novel feature of Hoffman and Kunze is that most of their theorems and proofs generalize the concepts of the real/complex numbers into arbitrary "fields" of "scalars."

HK is billed as a freshman text at MIT. (Or, at least it used to be.) As such, I'd rate it as stunningly hard as it draws rather significantly on abstract algebra (ring theory) by the time it covers the "usual" topics of a linear algebra course....

Chapter 1: Linear Equations Section 1.1: Fields Page 3. Ho man and Kunze comment that the term "characteristic zero" is "strange." But the characteristic is the smallest n such that n 1 = 0. In a characteristic zero field the smallest such n is 0. This must be why they use the term "characteristic zero" and it doesn't seem that strange.

Hoffman & Kunze is to linear algebra what baby Rudin is to analysis. If you plan to major in mathematics or physics, you should read it, study it, and do as many exercises from it as possible. The amount of abstract algebra in H&K is minimal, and all the definitions/background is provided so that the text is self contained.
